COMPOSABLE UI

CONFIGURE THE RIGHT USER EXPERIENCE WITHOUT CUSTOM CODE

Operational workflows that adapt as fast as your warehouse does.

Overview

Composable UI is Softeon's no/low-code framework for defining and orchestrating operational workflows within the WMS. Instead of hard coded screens, workflows are built using Forms & Flows:

- Forms define what the user sees and interacts with on the screen
- Flows control data access, API calls, business logic, and which Form is rendered next

By chaining Forms together with Flows, teams can create, modify, or optimize end to end operational workflows through configuration instead of custom development.

Warehouse operations are constantly evolving. Composable UI makes the Softeon WMS configurable by default, so user experiences can adapt without creating a custom copy of the application.

- Deliver an optimized UI/UX tailored to each operation

- Avoid costly, brittle UI customizations

- Reduce the impact of upgrades by minimizing UI-specific changes

Result: faster change, lower risk, and a future-proof operational interface.

Benefits

No Dedicated Frontend Development Required
Forms and Flows are configuration files, allowing changes to be created, tested, and deployed like any other configuration.

Upgrade-Friendly by Design
Customers get the UI they need without forking the underlying WMS, simplifying upgrades and long-term maintenance.

Configurable, Not Customized
Standard Softeon operational workflows are delivered out of the box and tuned through configuration to find the right user experience.
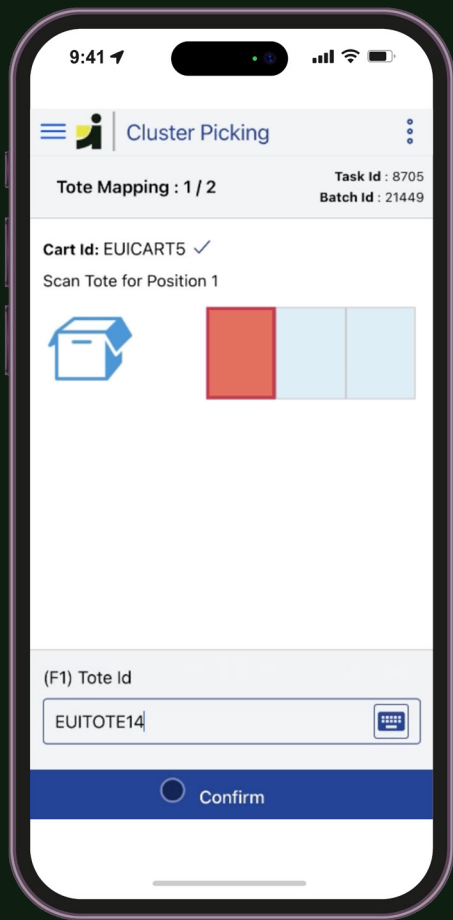

Built for Operational Flexibility
Screen flows, data behavior, and decision logic can be adjusted as processes, labor models, or automation strategies change.

How It Works

1. Define the Form (layout, fields, actions)
2. Configure the Flow (data access, API calls, business logic)
3. Chain Forms together into an operational workflow
4. Test and deploy — no UI code required

Because everything is declarative, workflows are easier to evolve, govern, and eventually automate.

Who Configures It?

Today, most Composable UI configurations are delivered through Softeon Professional Services and certified partners, ensuring best practices and operational alignment.

Over time, select power users will be able to configure and extend their own workflows as tooling and governance continue to evolve.
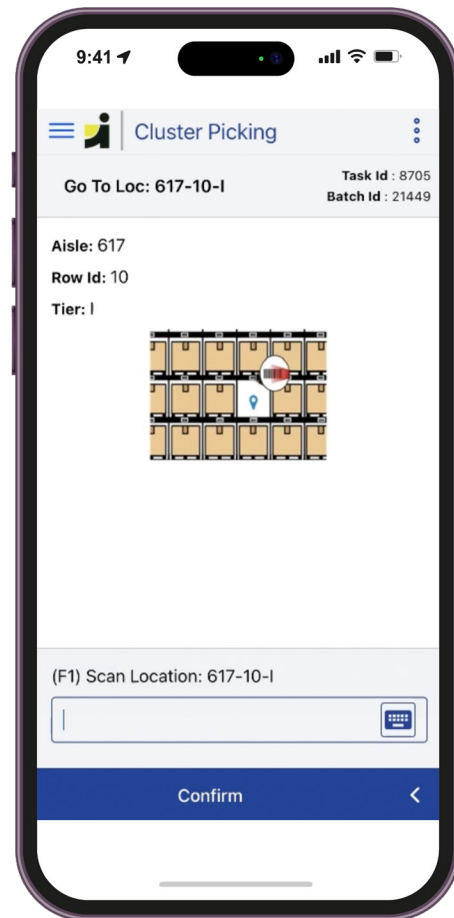

Platform Support

Composable UI is available as both:

- **Web-based UI**
- **Android application**

Ensuring a consistent, configurable experience across devices and environments.

Turning Configuration into Competitive Advantage

Composable UI is part of Softeon's WMS Enablement Tools, giving customers the flexibility of custom workflows with the safety and scalability of a standard WMS, enabling faster change today and simpler innovation tomorrow.
